

Defensive Drone Strategy Matrix

Rows are target-selection policies. Columns are the three assignment regimes.

Targeting Policies	Assignment Regimes		
	Corridor	Collaboration	Global
Optimized Weighted matching Replans with intercept-time and deadline-risk scoring.	Optimized Corridor Linear assignment inside the owned sector with near-capture lock.	Optimized Collab Optimized corridor matching first. Idle defenders then assist with a small off-corridor penalty.	Optimized Global Same optimized scoring, but assignment is fully unrestricted.
Nearest Distance greedy Chooses the closest live attacker first.	Nearest Corridor Greedy nearest-target pursuit within the owned sector.	Nearest Collab Nearest-target corridor rule first. Idle defenders then assist nearby overloads.	Nearest Global Greedy nearest-target pursuit across all live attackers.
Earliest Deadline Urgency greedy Chooses the attacker with the shortest time to target.	Deadline Corridor Urgency-first targeting inside the owned sector.	Deadline Collab Urgency-first corridor rule first. Idle defenders then help the most urgent leftovers.	Deadline Global Urgency-first targeting across all live attackers.
