

# Experiment Changes Summary

Scope: experiment setup only. No policy or solution logic changes are summarized on this slide.

## Attack swarm

300 attackers  
per experiment

## Defense sweep

10-100 defenders  
step size 10

## Start range

Attackers start  
about 5 miles out

## Primary metric

Count attackers  
that still get through

## What Changed in the Experiment

- Scaled the threat load to a fixed 300-attacker stress case.
- Expanded defender inventory into a full 10-100 sweep.
- Moved the attacker start point farther out to about 5 miles from the defended asset.
- Added explicit breach accounting so the experiment reports missed attackers.

## Knobs and Readouts

Sweep along these experiment knobs:

Attacker count /  
attack load

Defender  
count

Attacker speed

Defender speed

Distance from target

## Worst-case framing

Worst cases are now framed by defender availability and attacker stand-off distance.

## Interpretation

Experiment changes only.  
No policy or assignment-rule changes are included here.
